Skills

Programming	Python, JavaScript, TypeScript, Solidity
Backend	Node.js, Express.js, REST APIs
Databases	PostgreSQL, PrismaORM, Redis
Cloud/DevOps	GitHub actions, Docker
Blockchain	Solidity, Ethers.js, Sepolia Testnet, OpenZeppelin
Tools	Git, GitHub, Postman

Projects

Stateful AI-Driven Payment Engine

- Architected a high-concurrency payment engine using TypeScript, Node.js, Express.js, PostgreSQL, Prisma ORM, Redis, and Zod.
- An idempotent transaction pipeline built using Redis locks, eliminating race conditions and preventing dup payment processing.
- Developed an LLM-driven failure simulation framework using Groq API to generate deterministic test scenarios and validate system.
- Tracking the chronological sequence of requests across multiple asynchronous events depicting statefulness.

DecentralizedFinance(DeFi) Staking Protocol

- Built a full-stack DeFi staking platform using Solidity, React.js, Ethers.js, and OpenZeppelin, deploying secure smart contracts on Ethereum Sepolia.
- Engineered a $O(1)$ reward distribution algorithm supporting dual-token currency and time-locked staking rewards.
- Implemented cumulative accounting techniques to eliminate unbounded loops and improve smart contract scalability.
- Developed an event-driven Web3 state layer that synchronized on-chain events with the frontend while maintaining secure transaction workflows.

Education

Dayananda Sagar Academy of Technology & Management (DSATM)

[Bachelor of Engineering]
Degree: Computer Science and Engineering (Internet of Things and Blockchain Technology)

CGPA: 8.4

Achievements

- Presented a research paper on a lightweight blockchain framework for secure healthcare IoT analytics at the IEEE ICICS 2026 Conference.
- Served as a member of the organizing team for a college hackathon, coordinating event management and ensuring smooth execution.
